**Project Overview**

The Community Tool and Equipment Lending Library System is an easy-to-use online platform built for barangays, neighborhood groups, and community organizations that share tools and equipment with local residents. Instead of relying on manual paper logs that get lost or hard to read, the system provides one shared online space where staff can manage every part of the lending process and keep records up to date. It solves common community lending problems such as losing track of who borrowed an item, missing late returns, forgetting to check if tools were returned broken, and guessing which tools residents need the most.

The entire platform works through four connected core parts that take care of every step in the lending process. First, staff organize the inventory by adding or editing tools, tracking their overall count, checking how many are currently available, and keeping note of their working condition. Second, when a resident borrows an item, staff log the loan with the borrower's details and set an expected return date. When the resident brings the tool back, staff mark the return date, check if the tool is in good shape, and automatically put the item back into available stock.

If a resident wants a tool that is currently checked out, the third part of the system adds them to an organized waitlist so they are automatically notified as soon as the item comes back. Finally, the system keeps track of overdue items, assesses fines or records payments if tools return damaged, keeps borrower history, and creates easy-to-read charts showing popular tools and damage trends to help staff make smart decisions. By linking these steps together, the system makes tool sharing simple, prevents lost equipment, and encourages everyone in the community to be responsible.

**Key Features**

- **Inventory Management Subsystem** – Add, edit, and remove tools and equipment; track category, condition, total quantity, and available quantity.
- **Borrowing and Returns Subsystem** – Record new borrow transactions with borrower details and expected return dates; process returns, update item condition, and automatically restore available stock.
- **Borrowing and Returns Subsystem** – Record new borrow transactions with borrower details and expected return dates; process returns, update item condition, and automatically restore available stock.
- **Monitoring and Reporting Subsystem** – Track overdue borrows, view individual borrower history, assess fine payments and track payment settlements for damaged tools, and generate reports on the most frequently borrowed or damaged items.
